

Rødovre Municipality New children's institution on Vårfluevej

The day care institution is built to 80 units and amounts to approximately 680 m² on one floor. The area of the plot is approximately 3,500 m².

Rødovre Municipality, the Building Department, is responsible for the design of architect and landscape architect work, design management and construction management.

Damgaard assists Rødovre Municipality with all advisory services - Advice before design - Advice in connection with design - Professional supervision - Delivery, preparation of operation and maintenance plan. The building's natural gas supply is being prepared for connection to district heating - is expected to be expanded in the area.

The building is designed in principle as an angular building, where all group rooms and staff rooms are laid out towards the green living area. By tilting the roof around the diagonal, in addition to the necessary roof slope, it is achieved that centrally located rooms, such as the common room, have the greatest room height, while the rooms at the ends have a lower room height.

Execution: 2013 - 2014

Client: Rødovre Kommune, Ole Plasse
